## OFFICERS

PRESIDENT	[REDACTED]	Flock 1
CHAIRMAN	[REDACTED]	Flock 21
SECRETARY	[REDACTED]	Flock 7
TREASURER	[REDACTED]	Flock 22

## REPORT - Chairman and Secretary

Complications arising from the imports of sheep in 1989 and 1990, and the necessity of computerising an enlarged flock book to facilitate the printing of future editions, have resulted in the delay in producing the years 1990 and 1991 - for this we apologise. The flock return form for 1992 is included, as is the membership renewal form. Please return both before 1 September so that the 1992 Flock Book and "Stock for Sale" lists can be sent out this Autumn. An extra copy of the membership form and a copy of our information sheet are enclosed so that they may be passed on to buyers of stock - the Secretary has spare copies.

As in the first year the positions of officers were filled to satisfy bank requirements. We would like to hear from members who would be willing to join the present officers to form a committee, from which office holders could be elected and which would help to run the expanding activities of the Group, including participation in the Fourth World Congress on Coloured Sheep, University of York, 25 - 29 July 1994, to which we have had an invitation from the organisers, the Rare Breeds Survival Trust. Delegates will be visiting the National Sheep Event 1994 at Malvern at which we will have a stand. [REDACTED] who represents the CSBA on the Organising Committee, will represent us at York, and [REDACTED] will be at Malvern.

The Group was represented at the Northern Small Farming Exhibition at Harrogate in May, 1991 and 1992, and also at the Small Farming Event at Stoneleigh in September 1990 and 1991 - all at the invitation of the organisers, the "Smallholder" magazine and the Royal Agricultural Society of England. We will be taking our stand to the South Western Small Farming Exhibition to be held at the Royal Bath and West Showground at Shepton Mallet, Somerset, on August 22nd and 23rd 1992, we look forward to seeing many members there. Offers of help to [REDACTED] please, also locks of wool, of as many different colours as possible, to form part of a collection which [REDACTED] has been asked to send to Australia before the 1994 Congress, and which could be collected from members at this show. We are much indebted to [REDACTED] for her help and the loan of her sheep at both Harrogate events. These venues are excellent for promoting our breed and for advertising stock for sale. Next year we hope to take the stand to the South East, namely to the Horton Park Farm Show where the breed has been well represented in past years. Stock for sale (or exchange) lists should be sent to [REDACTED] as early as possible in August, so that they may be exhibited at the show at Shepton Mallet and - in shortened form - distributed in the Autumn with the 1992 Flock Book.

We wish to congratulate [REDACTED] flock 46, on her win at the Coloured Sheep Breeders Association Summer Event in July last year where her ewe "Olwyn" won first prize in the "Longwool on the Hoof" class, and was also judged Show Champion.

[REDACTED]  
June 1992.

## REPORT - Treasurer

Present balance	£81 - 19
Outstanding for:	
Flock Book - printing, paper, covers and envelopes	£25 - 00
Hire of show stand at Shepton Mallet on 22 and 23 August, 1992	£15 - 04
Flock Book - postage	£13 - 53
Stand equipment	£23 - 00
Total outstanding	£76 - 57
Balance remaining	£ 4 - 62

 June, 1992

## ABBREVIATIONS

P. = pure, 100%.

All animals are single unless otherwise indicated.

It is up to flock owners to describe their animals as they think fit. A much simplified translation of the genetic colour code is as follows:

Awt = white, Ag = grey, B = black, b = brown.

Wenic	1991	50%, 50% coloured Wensley, Awt/S.	see below	Michaele
Icwen	1991	" " " " Ag/B.	see below	Panda

Both these lambs, sired by Kernow Sir Francis Drake, I have retained as the fleeces are fine, long, waved, and lustrous as in the Wensleydale, but more open than the Wensleydale ringlets, and I am interested to see how their coats will grow after shearing. 1992 - All four fleeces superb.

Females

Wenica	1991	50%, 50% coloured Wensley, Awt/S.	see below	Michaele
Icwen	1991	" " Ag (reverse badgerface)	see below	Panda

Both these lambs retained, details as above.

## ICELANDIC WOOL AND SHEARING

Wild sheep have coats with two types of fibre: hairy kemp and fine wool, both of which are shed naturally. In the highly domesticated breeds of today the fibre varies from breed to breed. It may be soft and finely crimped, as in the Ryeland, - fine, lustrous, wavy hair/wool, like the Wensleydale, - or the, straight, coarse hair of mountain breed like the Blackface. The capacity for a natural moult has largely disappeared but some breeds may still produce kemp which is shed periodically.

Early in domestication Saga sheep could have coats with three types of fibre: kemp, hair and wool, or just hair and wool. It is to the latter group that the Icelandic sheep belongs, and it still retains the natural spring break in the fine underwool whilst the hair continues to grow. The rate of growth varies with the time of year.

The time to shear, if you only intend to do it once a year, is at the time of the break in the undercoat. I think that the reason for British judges and wool graders wrongly assessing Icelandic fleeces as "cotted" is partly due to unfamiliarity with the breeds, but also because they may have examined fleeces which were shorn some time after this break has occurred. The fleece of the "Savanna Jacket" account, see over, was entered in the 1990 CSBA Wool Event and judged thus, but seemed to present no problems to Penny Lake whose first attempt it was to use fleece from this breed.

In addition to having two fibre types and varying growth rates, there is also a considerable narrowing of the fibre diameter of both wool and hair during the winter. Shearing once only means that you have staples which vary both in bulk and fibre fineness from root to tip, very different from breeds such as the long Wensley or short Ryeland. It is therefore preferable to shear twice a year, once at the Spring break, which may vary with the weather and the individual animal (any time from late March to June), and then again in late Autumn/ early Winter when an examination of the base of the staple will show when it is beginning to grow finer, this is the end of November in my flock.

This second shearing could be left until the sheep are housed a month or so prior to lambing and the cut made at the point where the finer fibre commenced growth, usually one to two inches from the skin. In this case shearing is best achieved by hand and would indeed present difficulties to a machine shearer who clips against the skin. Two shearings usually mean that you have a fleece in better condition with less accumulation of debris and contamination and the yield is increased. This information is based on my personal experience of the breed during the last six years. Of the small group of breeders who have used this method only one was not pleased with the result. We would be interested to hear from other owners so that we have further material for the next issue of the Flock Book.

### MY "SAVANNA" JACKET

[REDACTED]

I went to Avebury last year for the CSBA Summer Meeting and I bought my first Icelandic fleece. I could not resist the colour and the soft handling was lovely. I soaked it in a bucket of hot detergent water - several buckets actually - it was a large fleece - rinsed it and spun-dried it inside a pillow case. The final drying was done on a wire rack. "Now, how am I going to deal with this fleece, it is like two in one. There are outer "ginger" tips and a softer inner coat of beige with a separate cream coloured area." Because the colours were so different I decided to keep them separate. I flick carded the tips and spun them semi-worsted on my Haldane Orkney wheel with a ratio of 9:1. The plied result was a yarn of not quite double knitting thickness but of a marvellous colour. The remaining combings and inner coat I put through the drumcarder and spun shortdraw again at 9:1 but not quite as thick as before. I thought I would knit a jacket but I had ofcourse spun the yarn too finely for outerwear so I made up a design and knitted two strands together. I became short of yarn and had to knit the collar single thickness but I am pleased with the final result. I have not yet knitted the "ginger" tips but I have plans for a waistcoat. The epilogue to this story is a visit I made to the Small Farming Event at Stoneleigh last September when I was talking to a lady on the Icelandic stand - [REDACTED] who was able to identify my fleece. She showed me a photo of its original owner - namely Savanna - before and after her clip.

### THE HIGH - WHORL LAP SPINDLE

[REDACTED]

While browsing through a rack of carved wooden items in the Icelandic Craft Centre in Reykjavik I came upon a spindle with a hook in the "wrong" end. Somewhat surprised, I asked a lady, apparently a spinner, about the unusual configuration and she showed me how to use the Icelandic high-whorl lap spindle. Like the Icelandic sheep, this spindle is another survival from Viking times. Although spinning wheels were not uncommon in 19th century Iceland, the lap spindle was neither abandoned nor forgotten even in this century. The Icelandic lap spindle is used in a similar manner to the Navajo spindle, except that the whorl is towards the wool supply, and the cop of spun yarn is wound around the far end of the spindle shaft. The first step is to prepare a long roving. The spindle is used only to insert twist, not to draft the yarn. Drafting is done as the roving is prepared. Once you've made the roving, insert the spindle hook into the end of the roving and twist it between your fingers. When you've spun enough yarn, wrap it around the spindle shaft, back up over the whorl and through the hook. After the yarn is securely fastened to the spindle, you can roll the spindle along your leg from hip to knee for faster spinning. With practice, it is possible to give the spindle enough of a spin that you can bring it back for its next push while it is still turning. It may be necessary to twirl the spindle in your fingers several times until enough of a cop has built up to balance the weight of the whorl as the spindle rolls along your leg. Also wind the yarn onto the shaft in the same direction as the spin, or it will unwind during the rolling motion. The advantage of this kind of spinning is that it can be used to make extremely soft yarn. Because drafting and twisting are separate steps and the spindle is supported throughout the process, there is no strain on the yarn. You can use only the minimum twist necessary to hold the fibres together. This seems to be the secret of the traditionally soft and fluffy Icelandic knitting yarns.
